

**Loon Log 2026**  
**Dick West**  
**dnswest@netzero.net**

5.27.26

It's the end of May and I'm wondering about some of our other birds...I haven't seen any seagulls yet. They must be busy nesting elsewhere...I haven't seen swans in the lake yet. There are some in the shallows above the dam...I've only seen one family of Canadian geese coming by that I convinced to keep moving to someone else's beach.

I have no record of when seagulls start showing up but the swans and geese often compete with the loons for nesting spots. Historically we see several swan and geese families by now. Did the flooding change some of those dynamics??

At 8:00 this morning Andy took me on a complete tour of the lake to check on our loons. We left from his place just north of the sandbar and headed south on the east side of the lake.

We did not see any loons on or near the eagle tree platform. That was a disappointing start.

The southernmost area was a different story. We saw a loon preening just north of the platform and a loon sitting on the nest. All is well there with probably less than two weeks before we see a hatch from that nest.

As we headed back north we spotted an eagle in the eagle tree. Then we saw two loons near the Openo boat launch and another loon flew in to join them. They proceeded to have a morning conference but we continued on our way.

We went past the empty Greene property platform to the north end of the lake. Again we were disappointed by not seeing any loons along the way, especially in the far north end where there should be a pair nesting in the weeds somewhere on the west side.

We headed back south without seeing any loons until we reached Snowflake. A loon was sitting on that platform but we didn't see its mate.

Cruising on to Gorham Beach we again saw a sitting loon without another around. That pair should have a hatch within two weeks also.

Maybe the wayward loons we didn't see near their nests were all down at the morning conference.

When I left Andy's place I took a drive down M88 to give the eagle tree platform another look. Still empty. I did see two loons west of the weed bed, close but not right next to each other.

We expected to have five loon families to watch again this year and so far we have three occupied nest sites to keep our eyes on. Hopefully the other two will be productive as well. There is still plenty of time to lay eggs and raise chicks.

**5.26.26**

I took a late afternoon walk to Gorham Beach. Stopping at Joe's beach on the way I saw a sitting loon and the other loon in the middle of the lake preening. My thought was that the preening loon had just left the nest meaning I missed a changing of the guard. I walked out on Ron's dock and took this picture.

That nest is high and dry now. The lake level has been at about 7.60 all afternoon. I continued on and did some socializing with humans.

On my way back I stopped at Joe's beach again. And I timed it just right. I saw a loon sitting on the nest and the other loon in shallow water just a few feet away. The beginning of a changing of the guard! The loon in the water slowly and with significant effort scooted its way up through the reeds to a point about two feet from the nest and stopped. Keep in mind, this nest was constructed when the water level was probably eight or nine inches higher than it is now. That makes for a fairly tough climb for a loon. After about two minutes the sitting loon slid off the nest and scooted down to the other loon. They sat close to each other for about a minute before the leaving loon continued its push through the reeds into the water. The arriving loon then worked its way up onto the nest, checked the egg(s) and settled down...but only for a moment...then it rose up on its legs, arcing its back and neck down to turn the egg(s). I think it was turning two eggs but I often see what I want to see, and I couldn't actually see an egg. It then ruffled itself into position over the egg(s) and settled down. That whole sequence took less than ten minutes. I always feel very lucky when I time my arrival near a nest to catch that action.

#### 5.25.26

Took an early morning kayak ride. I could see a loon sitting at Snowflake from just north of the point so I stayed well away. I didn't see another loon but I was quite a ways away. Then I headed to Gorham Beach. All was well there with a loon on the nest. Didn't see the other loon. I stayed way out and went on to the sandbar and Andy's place. While Andy and I chatted we saw a single loon closely checking out that platform. At one point it did get up on the platform but quickly slid back off. I'm still wondering if there is a new pair of loons apartment hunting in the area.

#### 5.23.26 9:45 am.

These hummingbirds are unbelievable!

I filled the two cup feeder yesterday morning at about this time and it only has about a third remaining now. Three hummers on it at the moment. I'm going to need a 20 pound bag of sugar if this keeps up.

Much more exciting is the picture Dennis Landis sent to Andy of a loon on the Snowflake platform taken this morning from 200 yards away.

That sure looks like a loon sitting on an egg or two to me!  
Later in the day Dennis confirmed a loon was on the nest all day. Great news!

#### 5.22.26

Walked down to see the Gorham Beach nest still occupied. The waves from an east wind isn't bothering that nest. I saw a cute mallard family of seven ducklings about a week old or so tucked up in what I call Austin Creek out of the waves and wind. A cozy spot with probably lots of bugs to snack on.

#### 5.21.26

A clear, chilly morning with a bit of a breeze but decent enough for our hearty Loon Platoon to spring into action to get warning buoys in place near the three occupied nesting platforms...the southernmost platform, the eagle tree platform and the Snowflake platform. Jim Gilleylyn offered to use his boat for the task, so he and I ventured forth to get that job done. All went smoothly with loons sitting on the eagle tree platform and the southernmost platform. No loons in sight at Snowflake so that pair doesn't have eggs to sit on yet. Hopefully they won't change their minds and go back across the lake to nest. While Jim and I were loading the buoys and anchors at Andy's place a pair of loons were making a lot of effort checking out the platform there. We didn't see one get on the platform but they were both going around it and under it and looking up on it for quite a while, even having a conversation about it with head dipping and diving. Andy has told me about two loons checking it out several times lately. Is this a sixth pair on the lake...or perhaps the Snowflake/Greene pair expanding their options?? No way of knowing of course, but any pair needs to get sitting on eggs someplace soon. Time's a'wasting!  
By the way, I'm seeing three hummers on my feeder frequently now. Some of them must have declared a truce...but there is also still lots of chasing going on so it's not a universal agreement.

### 5.20.26 continued

More on hummingbirds...

I am not an educated bird watcher. I think we all know what a male ruby throated hummingbird looks like. At least one of those has been to my feeder regularly. The light green plainly colored hummers I see I have assumed to be female ruby throated hummingbirds. While I was trying to get a picture today my phone camera app identified the bird as an Anna's hummingbird. Apparently I have more than one species of hummingbirds patronizing my little cafe...and the technology imbedded in these cell phones is almost scary...

4:50 pm.

I checked on the Gorham Beach nest. A loon was sleeping on it, head tucked in, not bothered at all by the wind and waves. The nest seems to be high enough in these conditions. The gage reading in Central Lake at 4:00 was 7.78.

### 5.20.26

#### News Flash!

I guess I should have waited another day to send a report...

I checked on the Snowflake platform at 8:55 this morning and there were two loons on it!

One was sitting in the nest bowl and the other was resting on the edge of the platform picking at the straw.

This is a very good sign.

I'm confident that this pair is the same pair that nested on the Greene property platform last year. If they have mated successfully we should have a chick or two from that nest on or about June 18, 28 days from now.

### 5.19.26

While the loon nesting situation is a bit mysterious, my second favorite bird species has been making my hummingbird feeder a hot spot of activity.

Any of you Loon Watchers that have feeders out are well aware those hummers seem to spend more time chasing each other than feeding. Rarely have I seen more than one on a feeder at the same time for more than a few seconds. I was lucky to get this picture to share.

Not a great picture but better than an empty loon nesting platform. For a few moments today I actually saw three on the feeder at once...until a fourth hummed in to break up the party. (As I am writing this email the exact same thing happened...except the fourth bird's first attack didn't stop the feast. But its second volley sure did!)

At 7 pm I drove to check the platforms at Snowflake and the eagle tree. No sign of loons at Snowflake but, finally, there was a loon sitting on the eagle tree platform!

Great news!

Now if we can see a pair nesting at Snowflake or at the Greene's property and confirm nesting activity at the northernmost nest site we can relax and wait for chicks to start hatching.

Stay tuned...

### 5.18.26

I woke up expecting rain...but it was a decent morning so I took a kayak ride over to check the Greene property platform. Still vacant and no loons in sight. The straw on this platform has not been worked on to form a nest bowl. I did see a pair on my way back. They were way out and not heading towards either platform.

The weather was getting better so I went to check on my Gorham beach buddies. A loon was sitting and the other one was way out, slowly heading toward the nest. Thinking I might get to watch a changing of the guard I beached my kayak at Joe's beach. No changing of the guard. The one in the water slowly headed over to say hello to me. Glad to see my buddy again I went slowly out to meet it. We got within 30 yards of each other and it dove. And darned if it didn't come right over under water to give me a show. It circled under my kayak and back out the same side twice in kind of a figure eight pattern giving me a great view of its swimming skill. I've mentioned several times how impressive it is seeing them under water. This bird is so big when it is stretched out scissor kicking its way around. It surfaced close to me quietly for a brief chat then dove and wandered away, feeding along the dropoff. It sure gave me another memorable morning.

### **5.17.26**

My first paddleboat ride of the year...almost three hours and four and a half miles. My kind of morning. But the loon nesting situation hasn't improved. I did see two loons passing close to the Greene property platform and two more in a bay north of the sandbar. In each case they appeared to be a pair...so why aren't they occupying a nest? The Gorham Beach nest is still occupied. Hoping for a couple of chicks there early in June. Finally remembered to put up a hummingbird feeder today at 3:30. The first hummer found it at 3:39!

### **5.16.26**

My first kayak ride of the year. Just a short one. Went to check on the Snowflake platform. It was vacant but had a definite nest bowl in the straw. I paddled 3/4 of the way towards the Greene property to confirm that platform is vacant too. Very mysterious. What has happened to our loons?

### **5.14.26**

Checked those two again at about mid day.  
Same story.

I could see the Greene's property platform pretty well with my binoculars and it looked vacant.

### **5.13.26**

Checked on the Snowflake and Eagle tree platforms in the early afternoon...no loons on the platforms or in those areas.

### **5.12.26**

Just after 8am I took a ride up and down M88 to check on the Snowflake and Eagle tree platforms expecting to see a loon sitting on each of them. It was a disappointing ride. There wasn't a loon on either platform and no loons in sight. The excitement of seeing a loon on the Snowflake platform has been abated...at least for now.

11:20 am

A single loon stopped out front for a snack. One of my Gorham Beach buddies no doubt. It was cold and raining but I went out on our covered deck to say hello. It waved one foot but didn't have anything to say. Then it slowly moved to the east to check out a dock install going on. It went slowly by within thirty feet of those guys staying calm and quiet. These birds sure seem to know what could be a threat and what isn't.

### **5.11.26**

A loon was peacefully feeding along the dropoff at about 6:45. It gave me a wave so it must be one of my Gorham Beach buddies heading back towards the nest.

At 8:15 Andy picked me up and we moved the Greenes' property platform a little further from the nearest cottage and a little deeper. Now the pair that nested there last year has a choice to use that platform or the one at Snowflake. They spent a lot of their "nursery time" raising their young chicks last year near Snowflake so I'm curious to see which one they choose.

After a walk along the west shore near the northernmost nest area...without spotting a nest site or any loons...we drove down to Snowflake...and as soon as we pulled in close to that shore and spotted the platform we had our answer...a loon was on the platform!! Hurrah!! It was very exciting to see that. The other loon was right next to the platform.

Apparently the Greene property pair is now the Snowflake pair.

The loon slipped off the platform so we quickly left them to their nest building. Both loons were right at the platform as we drove away.

At about noon I drove down M88 to check on the eagle tree nest. Still empty. After scanning the area for several minutes I did see two loons very close to the platform. I watched for over a half hour. A few times one of them headed up to the platform

as if it would hop up on it...but never did. At one point a cormorant landed close to them but on the other side of the weed bed. Both loons seemed to head toward it but the cormorant didn't stick around long.

At about 6:00 I went in to town and stopped to check the platform again. There was a loon resting very close to shore. As I got to the shore I scared off a small flock of ducks but the loon stayed right there. It even came a little closer to me for a chat. It gave me no information whatsoever but it did listen to me encourage it to get out on the platform. I didn't see the other loon. It did look to me like the straw on the platform had been rearranged some. When I came back a few minutes later the loon by the shore was gone and the platform was still vacant. Maybe tomorrow...

So at this point we have three pairs of loons nesting...the southernmost pair, my Gorham Beach buddies and the Snowflake pair...and hoping to have two more confirmed soon.

### **5.10.26**

We got up to the lake for the summer yesterday...finally!

Saw my first loon way out in the lake at about 8:45 this morning.

On my noon walk I saw there is a loon nesting at Gorham Beach on the almost submerged little island. I didn't see another loon in the area. A resident there mentioned the loon and nest were bouncing in the waves yesterday and today but hanging in there. Luckily the water level continues to slowly go down so that nest should be ok.

At 2:30 I took a ride around the lake to check the platforms.

My first stop was along M 88 near the eagle tree platform. It was empty, but there was a loon further to the north preening. I only saw the one loon there. The south end was all pretty choppy so it would be easy to miss any loons in the area.

My next stop was at The Maples. The southernmost platform was empty, but I did see a cormorant and a small flock of diving ducks in the area. After a few minutes, I also saw two loons close to the west shore having a conversation. One of them soon flapped its way across the water towards the north and stopped after a short distance. The other loon dove. I didn't see the one that scrambled away leave the area, but it did disappear. After watching a few more minutes I did see a loon on the platform! Also, there was another loon preening about halfway between shore and the platform. Looks like things are normal at the southernmost nest.

I drove down Walleye Lane to get another good view of the southernmost nest. Of course the loon was still sitting on the platform and it was good to see the other one very close by. I took a look at the Eagle tree nest, which is quite a distance, but it was clearly still empty. The water was much too choppy to see any loons in the water at that distance.

I stopped at the Openo launch site to see if I could see the eagle tree platform from there. The dock wasn't in the water yet so I was able to walk up on that to get a decent view at the empty platform. Didn't see any loons in the area this time. Just a pair of Merganser's close to me.

The platform at the Greenes' property was also empty and no loons in sight. I glanced across the lake with my binoculars and it appeared the platform at Snowflake was also empty.

I drove around to the public access at Snowflake Road and that platform definitely is empty. Again no loons in sight.

### **5.5.2026 A QUICK UPDATE...**

The nesting platforms are all in place.

Thanks to the diligent efforts of Andy Hickman, Bill Bailey and Tom Senecal yesterday morning, the last of the main four platforms was placed in the far south end of the lake.

Tom sent this picture of Andy, closest to the camera, and Bill as they pulled away heading back to the Maples.

Thanks, again, to Jeremiah at the Maples for the use of a boat and the launch site to get that job done.

The Loon Platoon was very fortunate to have added to the crew last year...and as you have read, the ranks swelled further this year. In fact, shortly after the platform was put in place at Snowflake we were told that it wasn't in the best spot. Jim O'Neal contacted me to discuss that platform. But believe me, Jim was not just calling to complain...he was prepared, willing and able to get that thing relocated...just didn't know how to handle the platform. Right away, Andy met Jim and Jim's brother Bob at Snowflake and moved it. Jim and Bob had a boat and trolling motor ready to go by the time Andy showed up. This is Jim, closest to the camera, and Bob after completing that project.

Two more Loon Platoon crew members!

So the platforms are in place and the loons are on the lake. Now we sit back and watch the show. Hopefully that show will include five pairs of loons raising ten healthy chicks.

To refresh your memory and help you keep an eye on the action, our five active nesting sites last year were:  
The northernmost nest - located on the west shoreline hidden in thick weeds at the cleared industrial site.  
The Greenes' property platform - on the east side near the 90 degree turn of N. Intermediate Lake Rd.  
The Gorham Beach nest - on a small "island" just north of the public access site.  
The Eagle Tree platform - mid lake next to a large weed bed south of Recreation Point near the eagle tree.  
The southernmost nest - mid lake next to weeds almost at the end of the lake.

There is a very good map of these locations on the Intermediate Lake Association website under the "Loon Platoon" tab. That map was put together by Ken Freeman who also maintains an excellent website at [Kencam.net](http://Kencam.net) which has a large amount of local information. His site has a "Loon Logs" tab that will also take you to the map.

Please observe the loons and their nests quietly from a distance. Remind your guests that loons hate jet skis coming anywhere near them.

When you do see action by the loons, especially now as they hopefully start using the platforms, please let me know what you see.

#### **4.28.2026 SPRING HAS ATTACKED!!**

And it has not been a fun thing to see...

Greetings Loon Watchers,

Most of you are aware of the high water level and flooding that occurred in mid April. That unprecedented event has caused major disruption and significant property damage in our area.

As the flood waters slowly recede we are starting to attend to the usual post winter activities we are accustomed to...including wondering about our loon friends and hoping for a productive spring for them and all other living things.

With that in mind it is time to give you an update. Following are the entries I have made to date in my Loon Log for 2026 regarding the status of the lake, the loons, the Loon Platoon and other general comments.

It begins...

Very heavy snow this year, including into mid March. 18 inches to plow on March 16 after plowing on the 14th, per Dylan Buffman.

**From here on, I'll list my entries in reverse chronological order for ease of scrolling.**

#### **4.30.26**

Andy Hickman sent a [very interesting article](#) that he saw in today's Record Eagle about the loons residing in the Seney National Wildlife Refuge in the UP. Our loon advisor, Damon McCormick, has been studying those loons for many years. That, along with more action by the Loon Platoon, makes this email worth sending so y'all get the news "hot off the press"!! Hopefully you can zoom in on that article for the details. Exciting loon news for sure! We are especially happy to have our friend Damon continuing to report it.

#### **4.29.26**

Even though conditions weren't ideal, Andy, Rich and Bill Bailey got the eagle tree platform in place.

This is Bill and Rich ready to shove off...

Then...success!

Andy's friend, Luke Hocking, provided the boat and the dock to launch from. Having Bill's small outboard motor was a huge help. Another job well done...with one more platform to go...the southernmost one. Could be several days before that gets handled.

#### 4.28.26

I received an email from Tim Cripsey who, with wife Teresa, lives on the river below the Bellaire dam. They were sitting in the bullseye of a disaster if the dam would have failed, no doubt sweating every minute while the water was rising. Their dock is still under water but they did not suffer any significant damage. As a bonus to us loon watchers, they took a kayak ride on the river from their place before the flooding and got this beautiful picture of an eagle sitting on its nest.

I highly recommend taking a cruise on that section of the Intermediate River below the dam to Lake Bellaire and check out that huge nest. I'm amazed that skinny looking tree survived the winter...but there it is.

As always, your comments and input are appreciated...now and throughout the year. Feel free to send me an email any time to [dnswest@net zero.net](mailto:dnswest@net zero.net).

#### 4.27.26

The water level is still over 8.6 and boating on the lake is still discouraged but the weather was decent so three Loon Platoon members...Andy Hickman, Duane Bush and Rich Ceuninck...donned waders and put out two nesting platforms. One at the Greenes' property, shown in these pictures

And one at Snowflake, shown here

There was a loon close by watching the operation going on at Snowflake.

Good work guys!!

I wish I could have been there to help out.

Later in the evening I received the following picture from an anonymous citizen showing our three stalwart Loon Platoon warriors belly up to the bar at Short's in complete disregard to the standards of conduct expected of Loon Platoon members!

Yep, that is clearly Rich, Andy and Duane celebrating their successful mission.

Geez, I turn my back for one minute and discipline completely falls apart...

Oh well, at least they didn't go to Short's before their mission. Who knows where those platforms would have ended up if that would have happened...

With chilly weather in the forecast for the next week or so it is hard to tell when the two platforms will be launched in the south end of the lake.

Let the loon watching season begin!!

#### **4.16.26**

At mid day the gage was at 10.43!!

Emergency precautions were taken at the Bellaire dam. 24 hour watch in place for several days. Some leaking was spotted with fill added to that area and sandbags put all along the earthen portion.

Evacuation procedures put into effect for areas below the dam.

Thankfully the dam held and a potential disaster was averted as the water level peaked and started to recede on April 16.

Unfortunately, many properties in low lying areas of the chain did suffer significant flooding.

All access points and boat launches on the chain in Antrim County were closed until the level recedes significantly.

For comparison, the court ordered winter level is 6.54 until May 15 or when the ice clears, so the peak was about four feet

higher than it should have been! That is a lot of extra water!! It took until April 21 for the level on the gage to drop a foot to

9.43. It only took about three short days for the level to jump up four feet...and five long days to go down one foot. Obviously, more rain will slow the decline.

#### **4.13.26**

The ice cleared today.

Snow was melting fast.

Along with heavy rain...

From Andy, April 13 at 7:21 am:

"3.1 inches of rain in the last 24 hours. 9.37 on the gauge at 7:20am"

And the water continued to rise...to dangerous levels...

#### **4.12.26**

Andy Hickman sent this picture of a pair of loons at his place at Recreation Point.

He said they told him they noticed I wasn't at my cottage yet so they were hoping he might get their nesting platform ready to launch. Andy assured them he was on it.

#### **4.8.26**

First loons confirmed in the open water south of the Central Lake bridge.
